Topping Head KOBOLD

The economical way of getting to those hard-to-reach high verges

In the areas which are not reachable with a normal topper KOBOLD comes in to its own. When fitted to an excavator you can then reach these areas safely and easily.

KOBOLD is an extreme duty machine and can chop wood up to 10 cm thick. Its working width is 1.12 m.

The mounting to the excavator is done through the adapter plate that the customer supplies. This is then mounted to KOBOLD by SAUERBURGER and then connected to the excavator in the normal way. Because of the extreme situations that KOBOLD will encounter, a special rotor was developed. This rotor allows the flails to 'duck' away when hitting hard non organic objects. This minimises the damage to the main rotor.

KOBOLD has changeable side skirts that help minimise contact between the flails and ground. The drive for the rotor is taken from the excavator hydraulics.

Type	Total width m	Working width m	Nr. of flails	Weight kg	Max. Hyd. Pressure bar
KOBOLD 1250	1,47	1,12	24 St.	690	420
